Inspection and test of the wet pipe system

The initial test required on a wet pipe sprinkler system is the hydrostatic test at not less that 200 psi for two hours, or 50 psi in excess of the static pressure, when the maximum static pressure exceeds 150 psi. During the hydrostatic test there should be no visible leakage from the sprinkler system piping.

The underground mains leading to the sprinkler system should always be thoroughly flushed before the mains are connected to the system. A weekly inspection of all water control valves and alarm control valves is recommended to certain they remain open. (Giacomini A200 valves have green indicator to see their open closed position from 50ft distance).

Drainage

All sprinkler pipes and fittings shall be so installed that the system may be drained

System Test Connections

Wet Systems

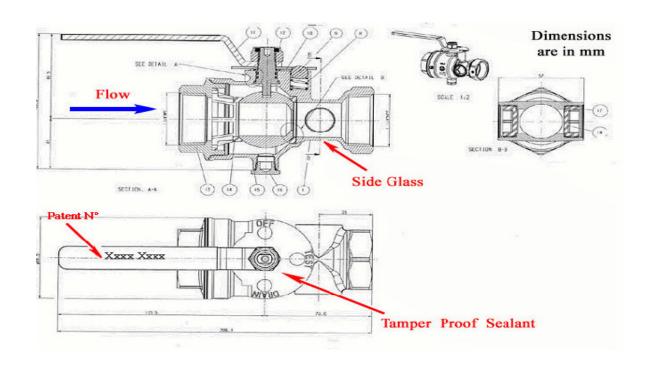

A test connection not less than 1 in. (25 mm) in diameter, terminating a smooth bore corrosion resistant orifice, given a f low equivalent to one sprinkler of a type having the smallest orifice installed on the particular system, shall be provided to test each waterflow alarm device for each system. The test connection valve shall be readily accessible. The discharge shall be to the outside, to a drain connection capable of accepting full flow under system pressure or to another location where water damage will not

Connections to the branch line (a and b) 1" and 1 1/4"

Orifice 1/2 " or 5/8" size

Giacomini Test and Drain valve merges in one valve the above two functions of testing and draining the system.

The valves will be available for two orifices: ½ inch and 5/8"

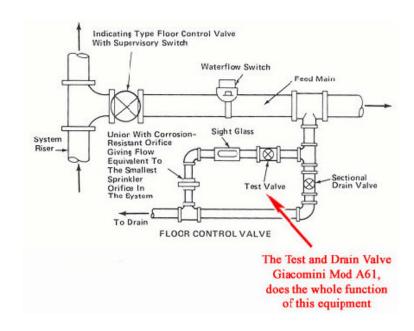

Special paten ted construction allows the ball be supported at the flow inlet side by a special plastic housing.

By rotation of the lever handle the valve can be set at:

- · OFF position
- · Test position
- · Drain position

Stem seals: two "O" rings with stem inserted from inside of the valve.

In multistory buildings where waterflow alarm devices are provided at each floor or where more than one alarm device is provided in one sprinkler system, a test type pipe shall be provided for

The intent of this section is to require inspector's test connection located in a which will provide for the testing of all flow alarm d evices.

It permits both an electrically operated alarm and a water motor alarm supplied from an alarm valve to be tested through a single test pipe.

Pressure
